

Operations of the UO Solar Radiation Network

Step by step overview the
SRML data processing

Josh Peterson
University of Oregon
IPC, Davos Switzerland
2025-09-22 – 10-10

Overview of the Solar Radiation Monitoring Laboratory (SRML) Network

- Mission: generate a long-term, high-quality ground-truth solar resource dataset.
- Operates across Oregon and Washington USA, providing regional solar radiation measurements.
- Established in 1975; currently operates 8 monitoring stations.
- Data is publicly accessible via the SRML website, NREL - MIDC, and pvlib.

<https://solardata.uoregon.edu/>

Overview of talk

1. Calibrations

2. Station installation

3. Data logger programming

4. Data collection

5. Post processing steps

6. Daily visualization

7. QC protocols

Calibration methods

Equations & Definitions:

- Responsivity: $R = \frac{uV}{\text{Ref_Irr}}$
 - R = conversion factor from voltage to irradiance units
 - uV = microvolt signal of sensor
 - Ref_Irr = reference irradiance (ACR + calibrated DHI sensor)

Field use:

$$\text{Irr} = \frac{uV}{R}$$

- Converts measured voltage to irradiance in W/m^2

Calibration methods

- **Reference & Traceability**

- Uses Eppley Absolute Cavity Radiometer (ACR) as reference for DNI
- Calibrations traceable to WRR via IPC and NPC events

- **A few details**

- Performed outdoors at Eugene station; calibrated sensors redeployed to field
- Typical calibration: 3 full days of data, 2-second sample rate, stable sky conditions

- **Shade/Unshade Calibration**

- Transfers ACR calibration to CMP22 pyranometer (DHI_Ref)

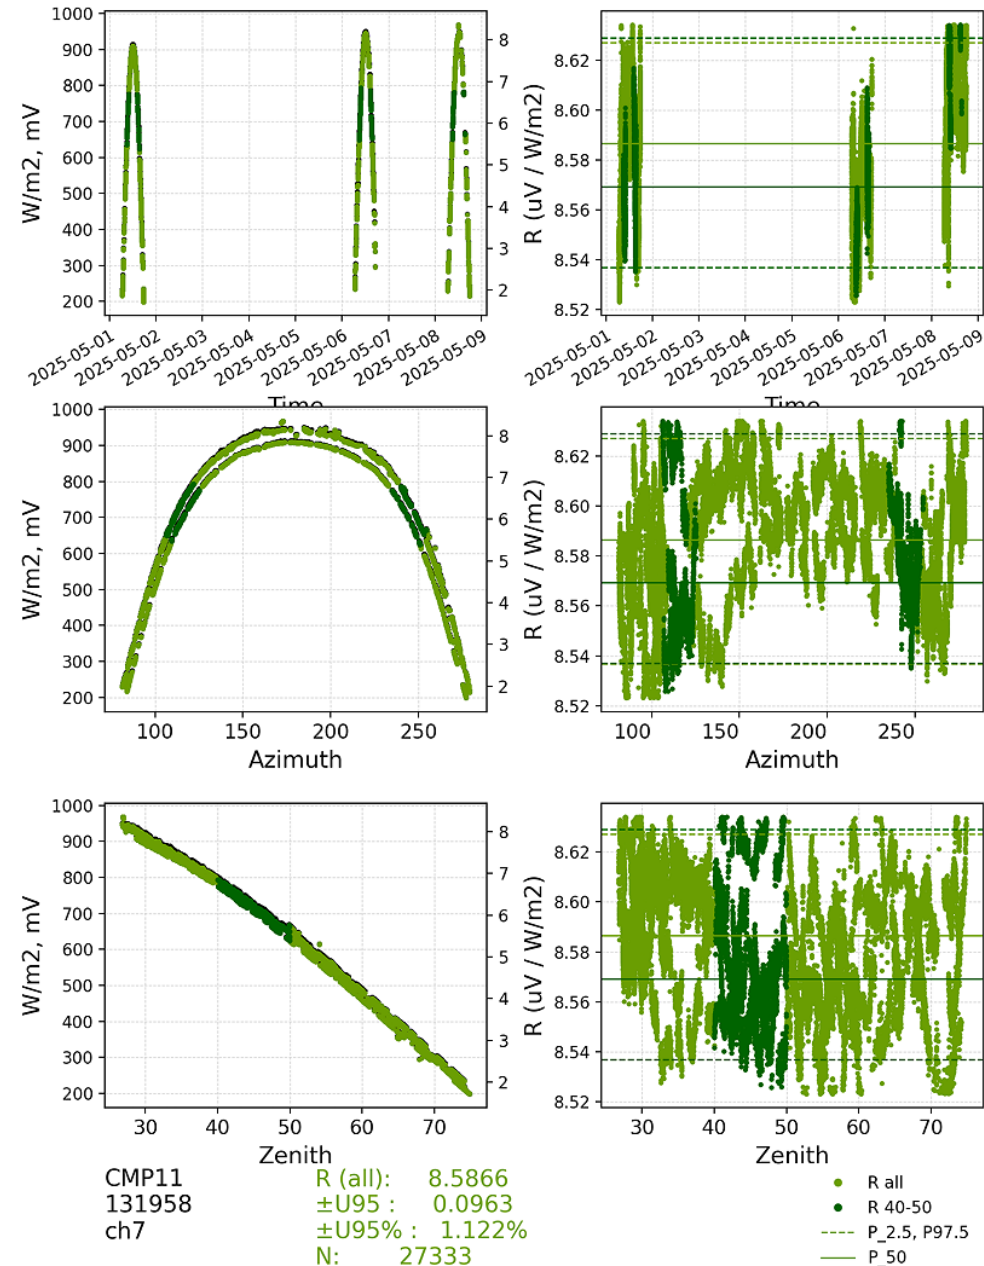

- Timing (example session):

- 0–2 min: shaded
- 2–4 min: unshaded (calibration period)
- 4–17 min: shaded
- 17–20 min: ACR self calibration

Remove first 40 seconds
after each transition

- **Component Sum Calibration**

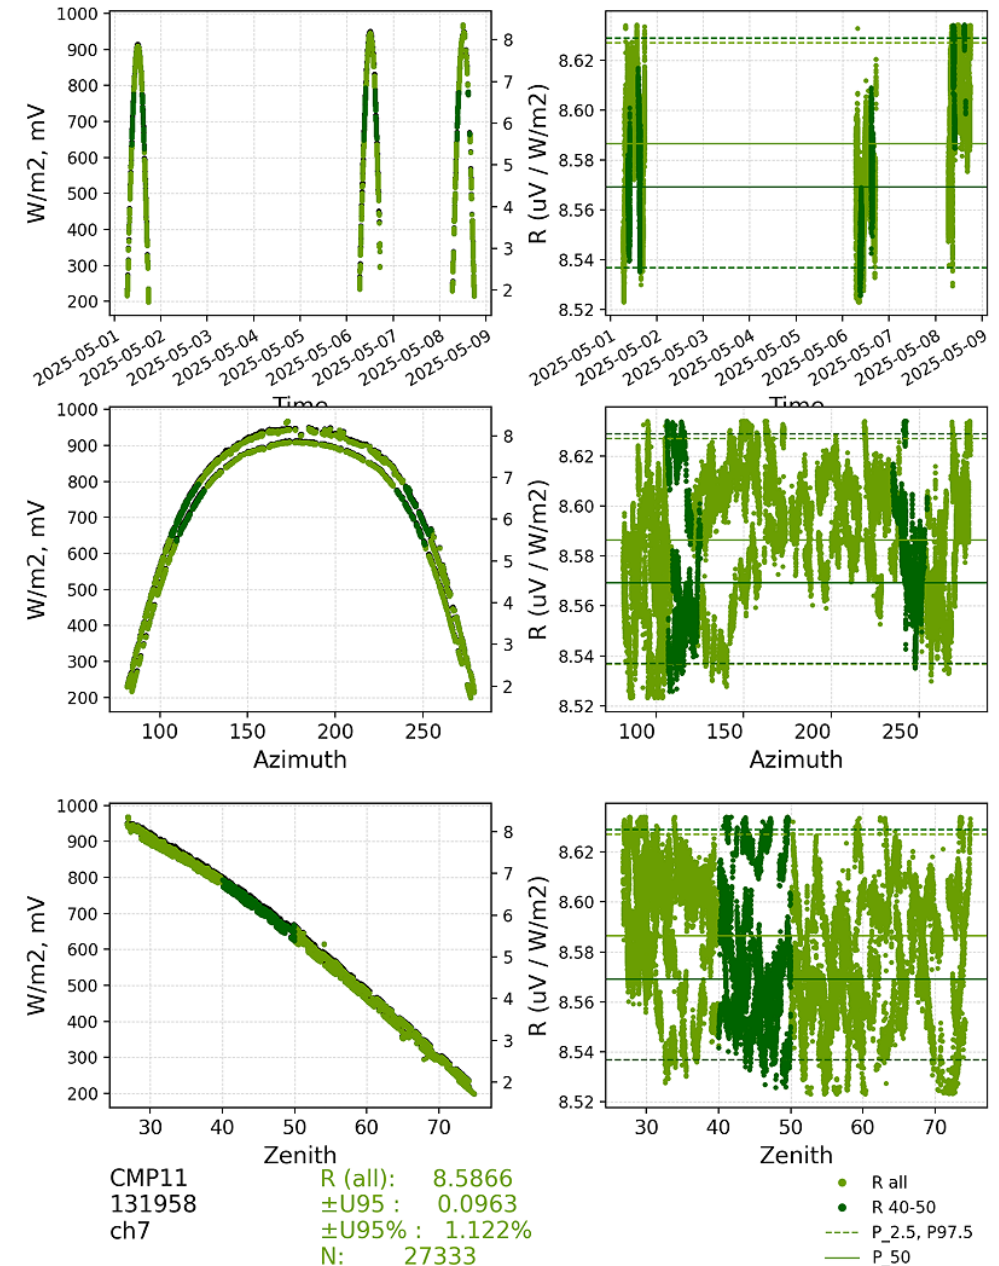

- Calibrates fleet of sensors from ACR and DHI_Ref

Automated calibration program

- Python script automatically filters outliers and generate responsivity values

1. Load data
2. Compute solar position
3. Remove non-clear sky data
All sensors
4. Remove sensor specific responsivity data
that is not consistent
Leveling, cleaning, insects ...
5. Compute median responsivity

SRML network

5 two-axis tracker stations

Burns, Eugene, Hermiston, Portland, Seattle

- GHI = CMP11
 - DNI = NIP
 - DHI = CMP11
- Eugene = CMP22, SR20
Eugene = CHP1, DR01-T1
Eugene = CMP22, SR20

3 RSR secondary stations

Silver Lake, Madras, Cheney

- GHI = CMP11
- GHI, DNI, DHI, = Rotating shadowband radiometer (RSR)

Goal: eventually transition all stations to two-axis tracker stations

Eugene (EUO) 1975 - 2025

Located on the UO campus.
GHI, DNI, DHI,
Tilted, Downfacing
UV, IR, Spectroradiometer,
MET

Seattle (STW) 2015 – 2025

Portland (PDO) 2024-2025

Hermiston (HEO) 1979 – 2025

Burns (BUO) 1979 -2025

Silver Lake (SIO) 2002 - 2025

Silver lake is representative of the second-class sites.

Oregon can have significant wildfire smoke (this is smoke, not moisture)

360 Panorama views taken at each site.
Correlated with measured features on the horizon.

Implemented LT maintenance button push

- When an local technician (LT) visits a site, they press a maintenance button.
- The button press is logged in the output table.
- This marker is used for QC, since maintenance often causes bad data

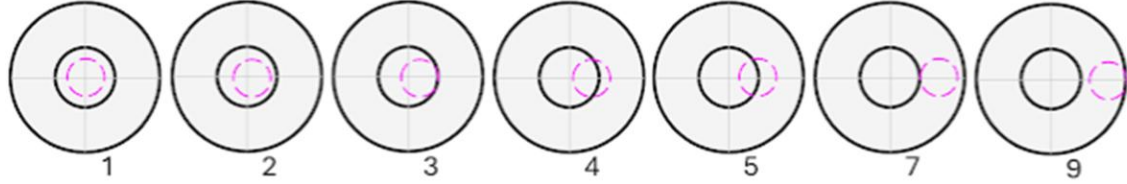

```
412      ' Detect if the button was pushed. (a pulse)
413      PulseCount (maint_button_push,1,14,2,0,1.0,0)
414
415      ' If detected
416      If maint_button_push > 0 Then
417          ' Only get in here if button is pushed
418          maint_timer = 0
419          maint_event = 1
420          maint_button_push = 0
421      EndIf
422
423      ' Increase timer in seconds
424      maint_timer = maint_timer + Scan_c
425      maint_timer_day = maint_timer / 86400
426
427      ' if the count is 5 minutes (100 3 second scans) (1
428      If maint_timer > 300 Then
429          maint_event = 0
430      EndIf
431
```

Online maintenance log sheets

- Use Google forms to generate an online maintenance form
- Goal: allows LT to report station status to the website in real time.
- LTs can use their phone to report values

GHI level

Observe the GHI bubble level. Record its position using the following scale.
10 indicates the level was not observed.

1 2 3 4 5 7 9

Not observed
10

4 and greater, sensor should be leveled

Choose ▼

	A	B	C	D	E

Data loggers

- Campbell
 - CR1000, 1000x, 3000, 6
- Scan rate 1, 2, 3 seconds (depends on station)
- Minute average table
- Measure voltage of sensors
- Apply responsivity on logger to generate irradiance
- Put both mV and Irr in output tables

```
463      ' GHI measurements
464      VoltDiff (GHI_mV,1,mV25,3,True,0,_60Hz,1.0,0.0)
465      GHI_Irr = GHI_mV * 1000 / GHI_R
466
467      ' DNI measurements
468      VoltDiff (DNI_mV,1,mV25,2,True,0,_60Hz,1,0)
469      DNI_Irr = DNI_mV * 1000 / DNI_R
470
471      ' DHI measurements
472      VoltDiff (DHI_mV,1,mV25,4,True,0,_60Hz,1,0)
473      DHI_Irr = DHI_mV * 1000 / DHI_R
474
```

Also computed on logger:

- Solar position
- Percent difference between GHI and GHI_Calc
- Maintenance button push recorded
- Set 2AP tracker clock with logger.
- Time it takes to complete scan

Data collection via Loggernet

- Data collected every 5 minutes
- Collected via cell phone or direct internet connection
- Data also collected by NREL-MIDC

Post processing – near real time

- Microsoft's Task Scheduler to run tasks every five minutes (similar to Loggernet Task Manager)
- PowerShell script is run every 5 minutes
- Goal: take data from .dat logger file and generate useable files ready for public dissemination

Post processing – near real time

Powershell code

Goes through each station

Calls various python scripts

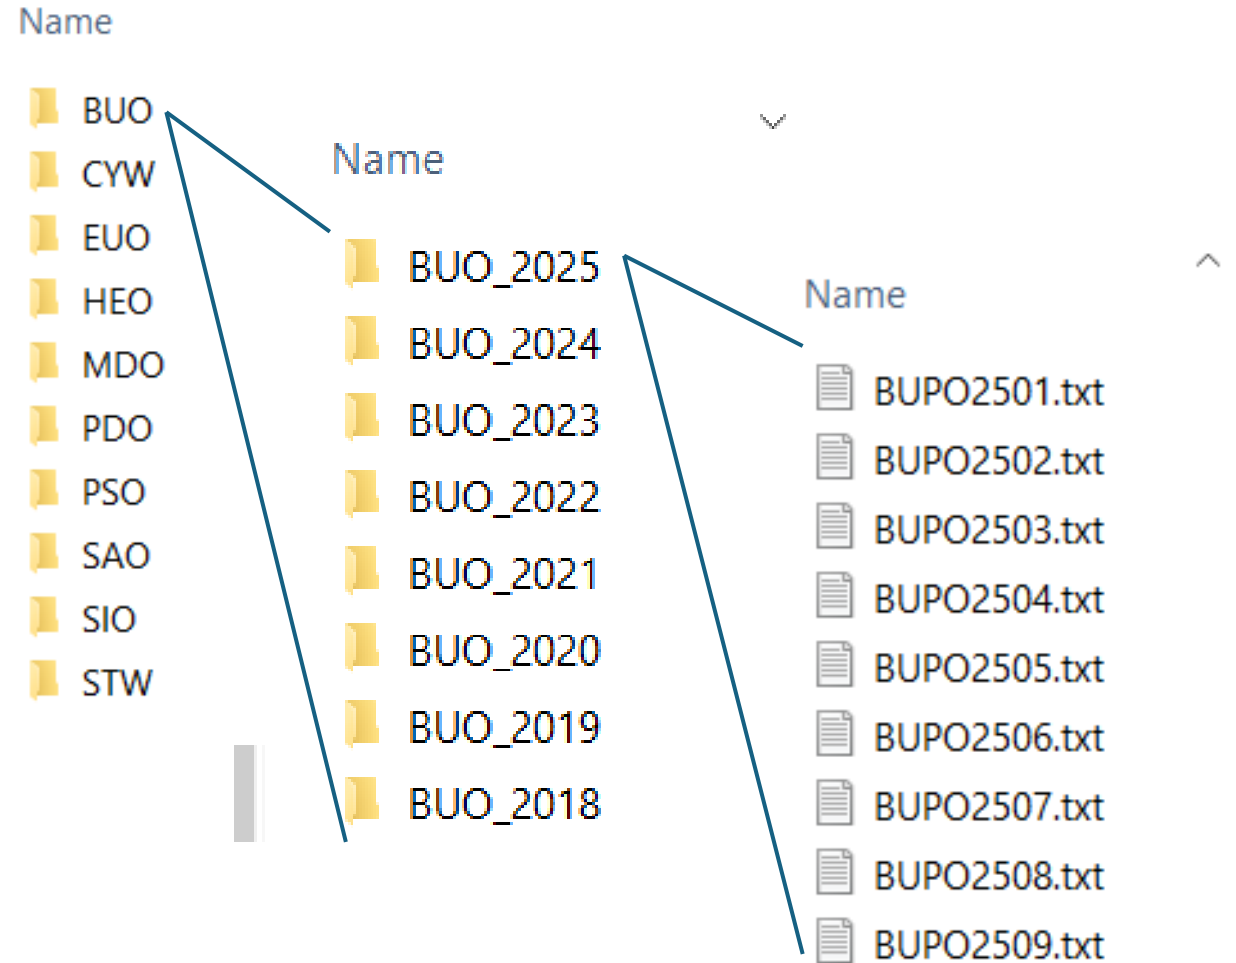

Each python script performs tasks to data

```
# Run all the processing scripts
```

python E:\	Address \	\SRML_AddMeasuredData.py \$datLocat
python E:\	Address \	\SRML_DailySummary.py \$cfLocationI
python E:\	Address \	\SRML_AddAdjustedData.py \$cfLocati
python E:\	Address \	\SRML_DailySum.py \$cfLocationPy
python E:\	Address \	\SRML_MakePreviousFormat.py \$sn3 \$
python E:\	Address \	\SRML_ZipFiles.py \$sn3
python E:\	Address \	\SRML_MakePlots.py \$sn3 \$cfLocatic

Data storage structure

- The SRML stores data in .txt and csv files
- Does not use a formal database
- The SRML stores data in one month station files
- Station / Year / Monthly file

Daily visualizations to the website

- Final post processing step generates current images of data.
- Published to the web
- Static .png image names referenced by html.
- NREL – SRRL's dashboard is relatively easy because they only have one location to show.

Daily visualizations to the website

- Final post processing step generates current images of data.
- Published to the web
- Static .png image names referenced by html.
- NREL – SRRL's dashboard is relatively easy because they only have one location to show.

SRML quality control (QC) process

- At the end of each month, files are QC'd.
- Goal:
 - flag good data good
 - flag bad data bad
- First automated QC implemented. Based on BSRN QC.
- Then manual QC applied via GUI.
 - Many buttons and features.
 - GUI based in python, uses Tkinter
